

# Khans of the Steppe Clothing Converter

## Requirements:

Blender ( 3.6 )

[IO Paradox Mesh Blender plugin](#) version 0.9

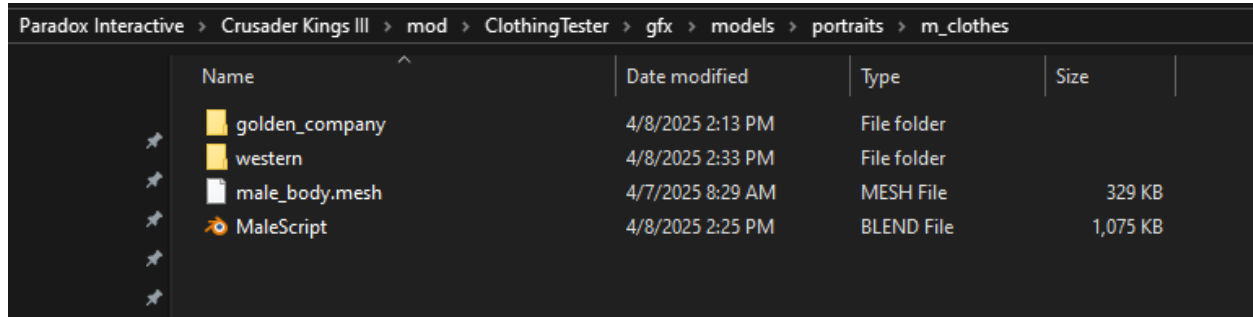

## How to use:

Before using this script, make sure your 3D mesh files are **backed up**. This script will override them, and if something goes wrong you could lose your work.

There are two pairs of files, maleScript and femaleScript. Each blend file has a corresponding body mesh.

The way the script works is simple, you place the pair of files in the directory where you want to convert meshes and run the script.

For example, I want to convert all male clothing, so I place the blend file within the m\_clothes directory, along with the male body mesh.

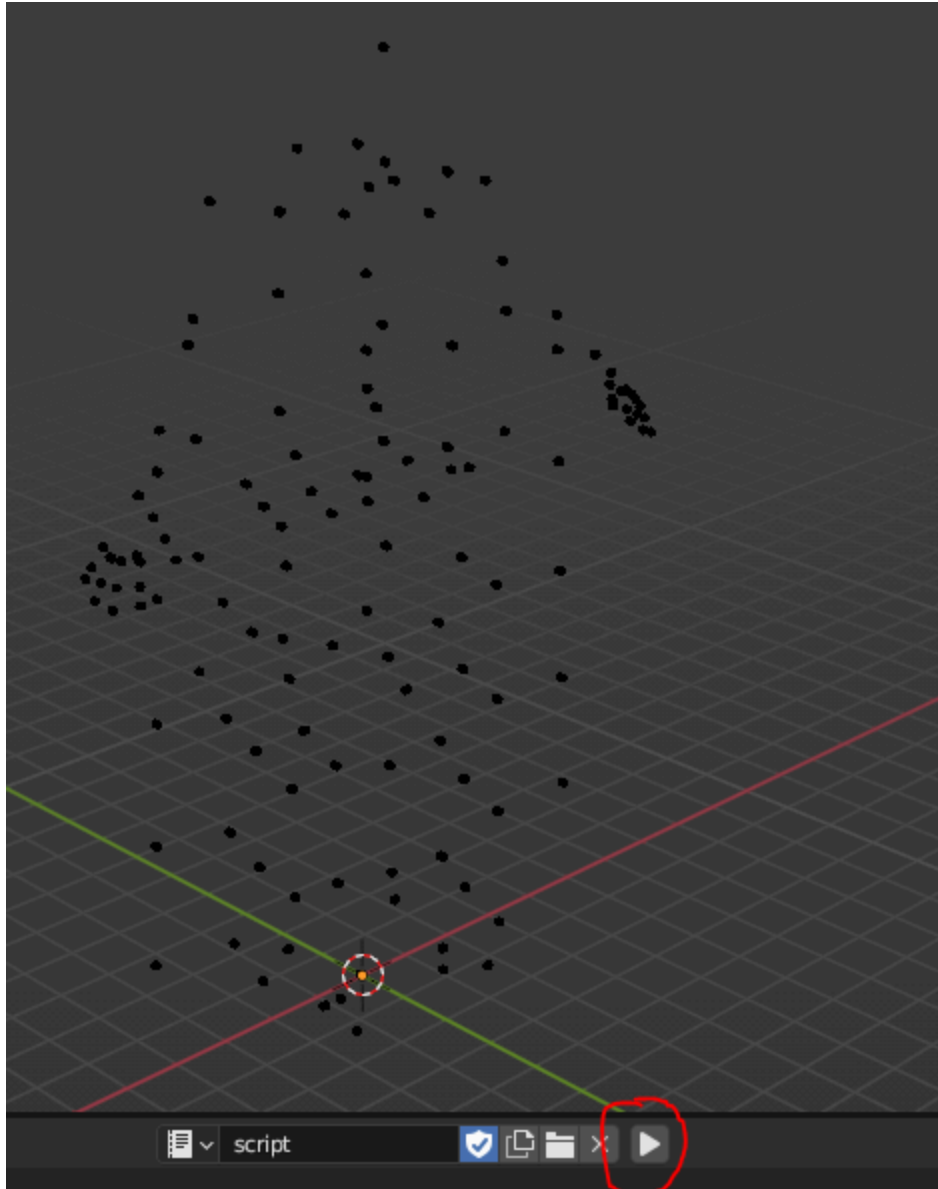

Then, open the blend file. In the bottom right you can see the script. Press the play button to begin the script.

The script will walk down the directory and convert each mesh. Note, loading and exporting meshes takes some time. If it looks like Blender has frozen please let it continue to run.

## NOTE:

This script is not super smart, it may convert files that aren't meant to if you don't follow the vanilla naming standard.

If your meshes/blendshapes are named similar to vanilla files you should be fine.

By default, the script will skip the following:

**MaleScript:**

**Meshes containing:**

“bs\_”  
“gaunt”  
"dwarf",  
"fat",  
"old",  
"muscle",  
"muscular",

```
        "female",  
        "f_clothes"]  
FemaleScript:  
    Meshes containing:  
        "bs_",  
        "gaunt",  
        "dwarf",  
        "fat",  
        "old",  
        "Muscle",  
        "muscular",  
        "m_clothes  
    Meshes starting with:  
        "male_"  
        "m_"
```

At the end of the process, your meshes should have the new sleeve joints and should work with the new DLC.

**NOTE:** This script does not add any sleeve weights, it simply exports the mesh with the new skeleton. If you want your clothing to leverage the new sleeve bones, you will have to paint these manually. If something was previously painted to the left or right sleeve bones, it was renamed to l\_sleeve1 or r\_sleeve1 respectively.
